                                                                                               The present sequence represents the bean phaseolin promoter, which CC is used to construct plasmids for the expression of the P. putida CC faoAB gene. The gene encodes an enzyme that may be used in the CC method of the invention. The specification describes a method for CC manipulating the metabolism of a plant, and comprises expressing a CC heterologous gene encoding fatty acid oxidation enzymes in the CC cytosol or plastids other than the peroxisomes, glyoxisomes or CC mitochondria of the plant. The method may be used to enhance the CC biological production of polyhydroxyalkanoates or novel oil compositions CC in a transgenic plant. Plants which may be used to produce these CC compounds in this way include Brassicas, maize, soybean, cottonseed, CC sunflower, palm, coconut, safflower, peanut, mustards, flax, tobacco and CC production and therefore increase the production of biomass (leaves, CX stems, stalks) by plants.
